# EDA by HPTLC

## Single compound(s)

→ chromatography-(bio)assay

## Parallel screening

→ mostly 20 extracts separated in parallel under identical chromatographic and environmental conditions

## Streamlined analysis

→ skip all the different methods (SPE, GPC, prep. HPLC) for fractionation, isolation and purification of substances, always followed by the bioactivity test → cost-effective

## Matrix-robust detection

→ (bio)assays not interfered by solvents and matrix

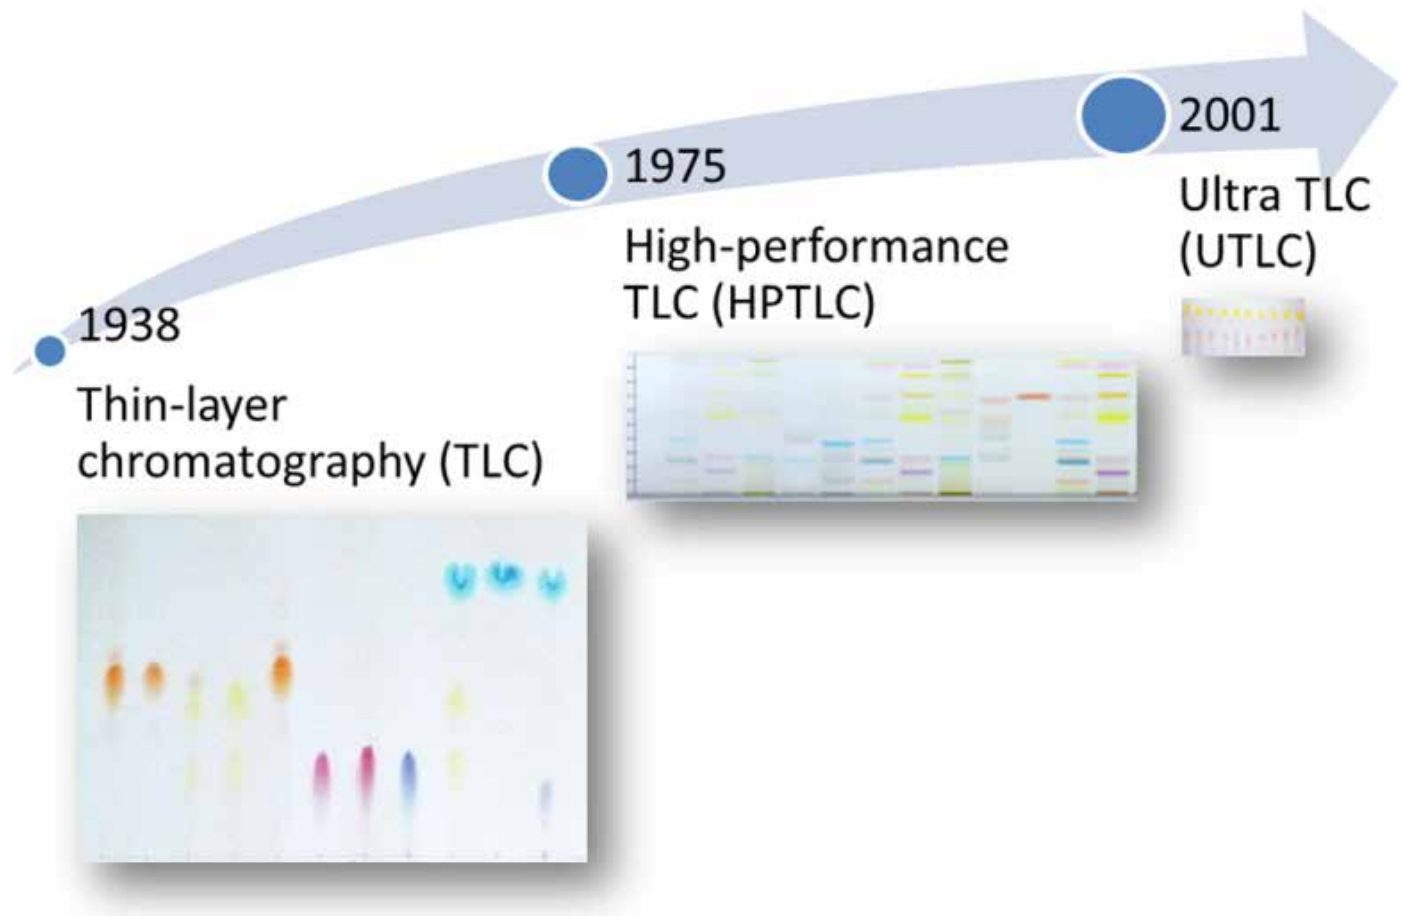

## Modular hyphenations

→ targeted coupling with HRMS, NMR...

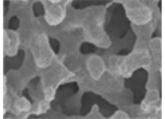

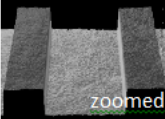

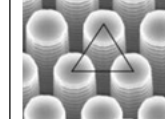

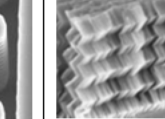

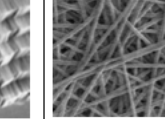

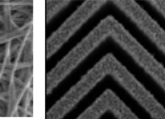

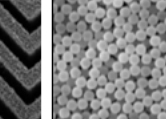

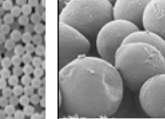

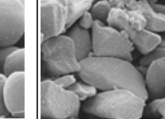

## Image/derivatizations

→ additional helpful information

# Miniaturization

# Novel layers
