

Biodetectors Workshop, Sorrento, Italy, April 2017

**SIMONI (SMART INTEGRATED MONITORING):
A NOVEL BIOANALYTICAL STRATEGY FOR WATER
QUALITY ASSESSMENT**

Ron van der Oost

Outline

- **Micropollutant risks: substances or effects?**
- **Effect-based water quality monitoring**
- **SIMONI 1.2 model & effect-based trigger values**
- **Future of regular water quality monitoring..?**

Effects or substances?

No one else has more...

1 2 9, 3 1 8, 8 4 0 ORGANIC AND INORGANIC
SUBSTANCES
TO DATE

A global team of scientists is continually adding substance information from the world's disclosed chemistry to the [CAS REGISTRYSM](https://www.cas.org), the gold standard for chemical substance information.

BIODETECTORS 2017

3

PFOS in eel (historical sample bank)

1999: routine analytical methods
2000: alternatives available

Highest risks occurred when compound was not yet measured..!

Kwadijk et al., 2010

WFD monitoring

**Non-chemical factors:
habitat, hydromorphology
microbiology, predation,
etc**

Integrative monitoring

Monitoring effects or substances..?

Bioanalytical tools:

- 😊 Limited amount of assays can give a cost-effective and reliable risk assessment
- 😞 Low substance specificity
- 😊 Bioavailability included
- 😊 Mixture toxicity included
- 😊 Metabolites included
- 😊 Unknown substances included
- 😞 Chronic exposure is difficult and expensive
- 😞 No accepted classification available
- 😞 Biomagnification not included
- 😊 No effects 🗑️ no worries

....

Dick de Zwart (RIVM, Netherlands)

Chemical analyses:

- 😞 Search for a needle in a haystack: obligatory analysis of more than 200 substances in drinking water
- 😞 Many analyses are yet impossible (e.g. matrix effects)
- 😞 Not enough toxicity data available for risk assessment (ERA)
- 😞 No information on bioavailability
- 😞 No information on mixture toxicity
- 😊 Direct comparison to substance-directed legal guidelines
- 😞 Low concentrations 🗑️ still worries
- 😞 Surrogate security and accuracy

....

Outline

- **Micropollutant risks: substances or effects?**
- **Effect-based water quality monitoring**
- **SIMONI 1.2 model & effect-based trigger values**
- **Future of regular water quality monitoring..?**

Effect-based water quality monitoring

Passive sampling

Biomarkers:
Biochemical changes

Bioassays

water  net

Smart monitoring

Alternative (WFD) monitoring methods:

- Passive sampling: time-weighted average
- Integrated monitoring: chemistry, biology & toxicology
- Toxicity screening: Identification hazards and 'hot spots'
- Risk analysis: identify relevant toxic substances (EDA)

Goal: better information on water quality for less €!

Passive sampling: time integration

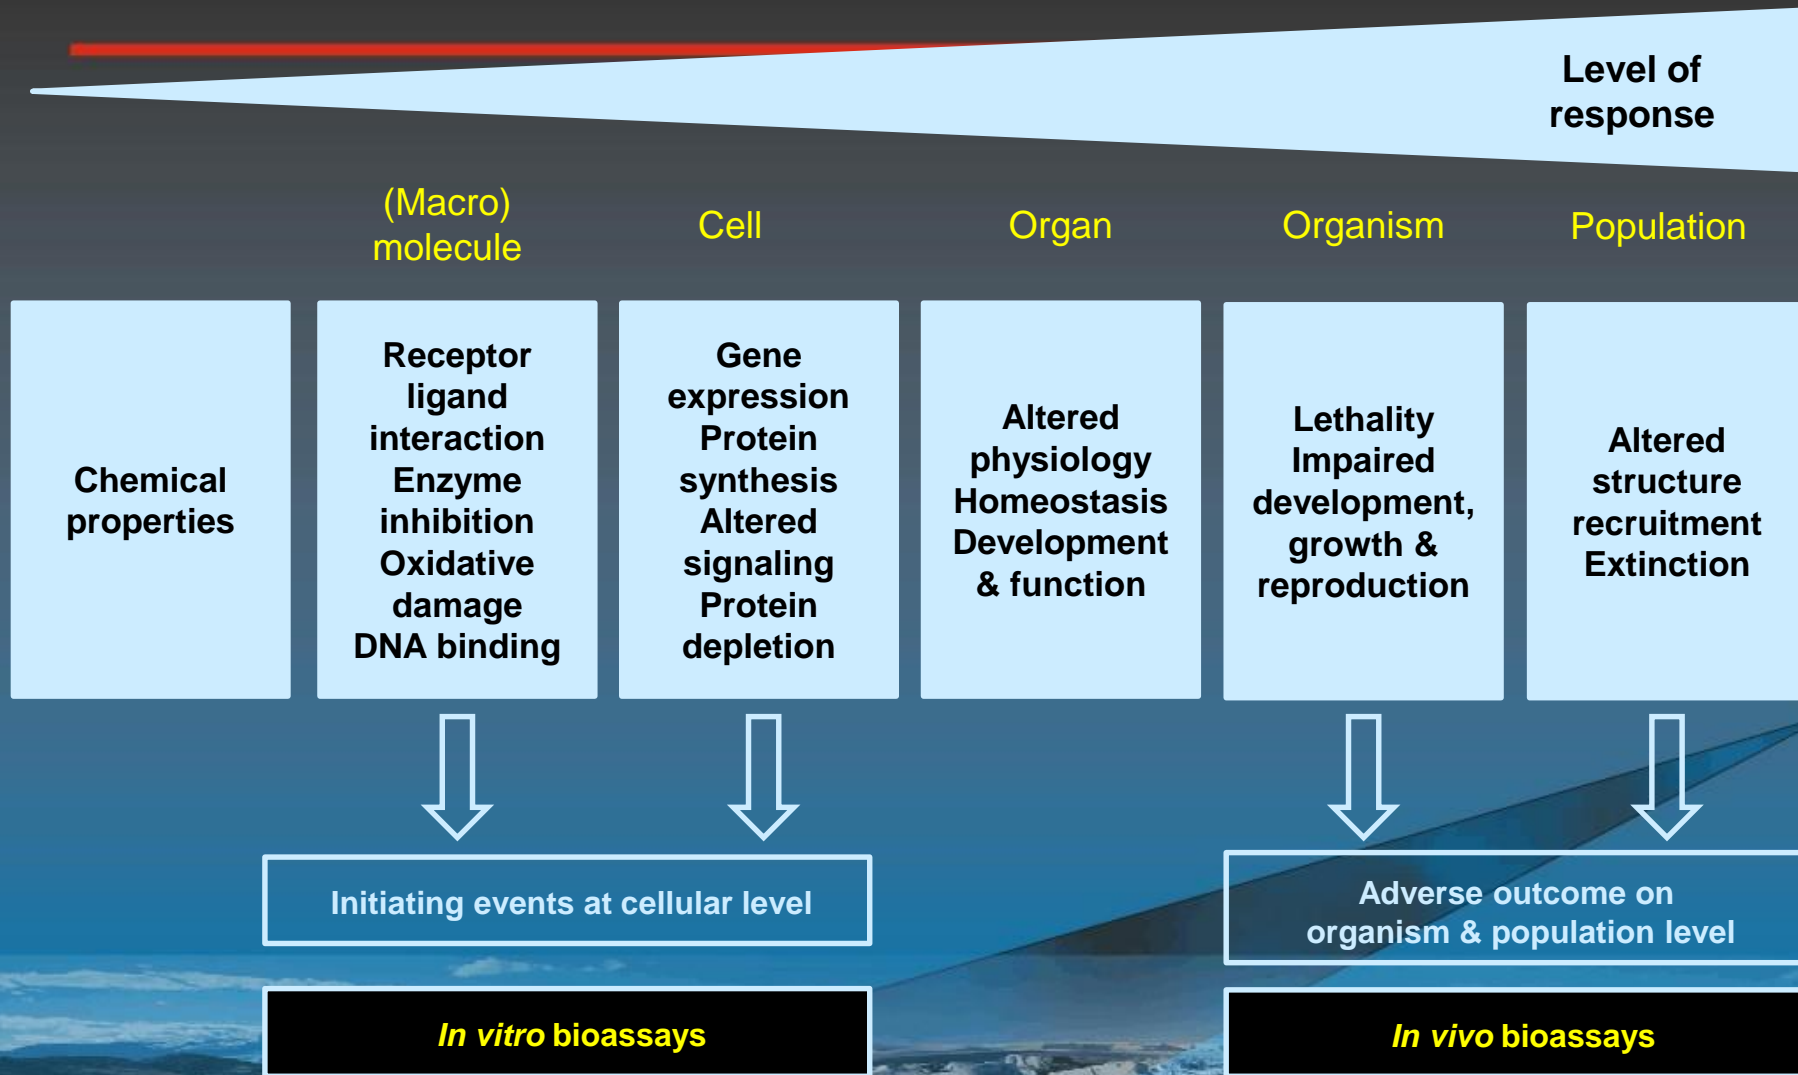

Grabsamples

Passive sampling

- Grabsamples are 'snapshots'
- PS is better for trends & time weighed average
- Lower sampling frequencies needed with PS

Adverse Outcome Pathways (AOP)

Relevance of observed toxicity

Toxicokinetics

Toxicodynamics

in vivo bioassays (whole organisms, non-specific)

ADME?

In vitro bioassays (cell culture, specific)

A: passive samplers

Outline

- **Micropollutant risks: substances or effects?**
- **Effect-based water quality monitoring**
- **SIMONI model & effect-based trigger values**
- **Future of regular water quality monitoring..?**

Convince regulators & policy makers

- Select validated high-throughput bioassays
- Design effect-based trigger values!
- Design a clear strategy for regulators
- Demonstrate that effect monitoring can be cheaper than chemical analyses
- Explain uncertainties of the approaches
- Realistic approach: no ostrich behaviour (“if we don’t measure it, we don’t have a problem...”)

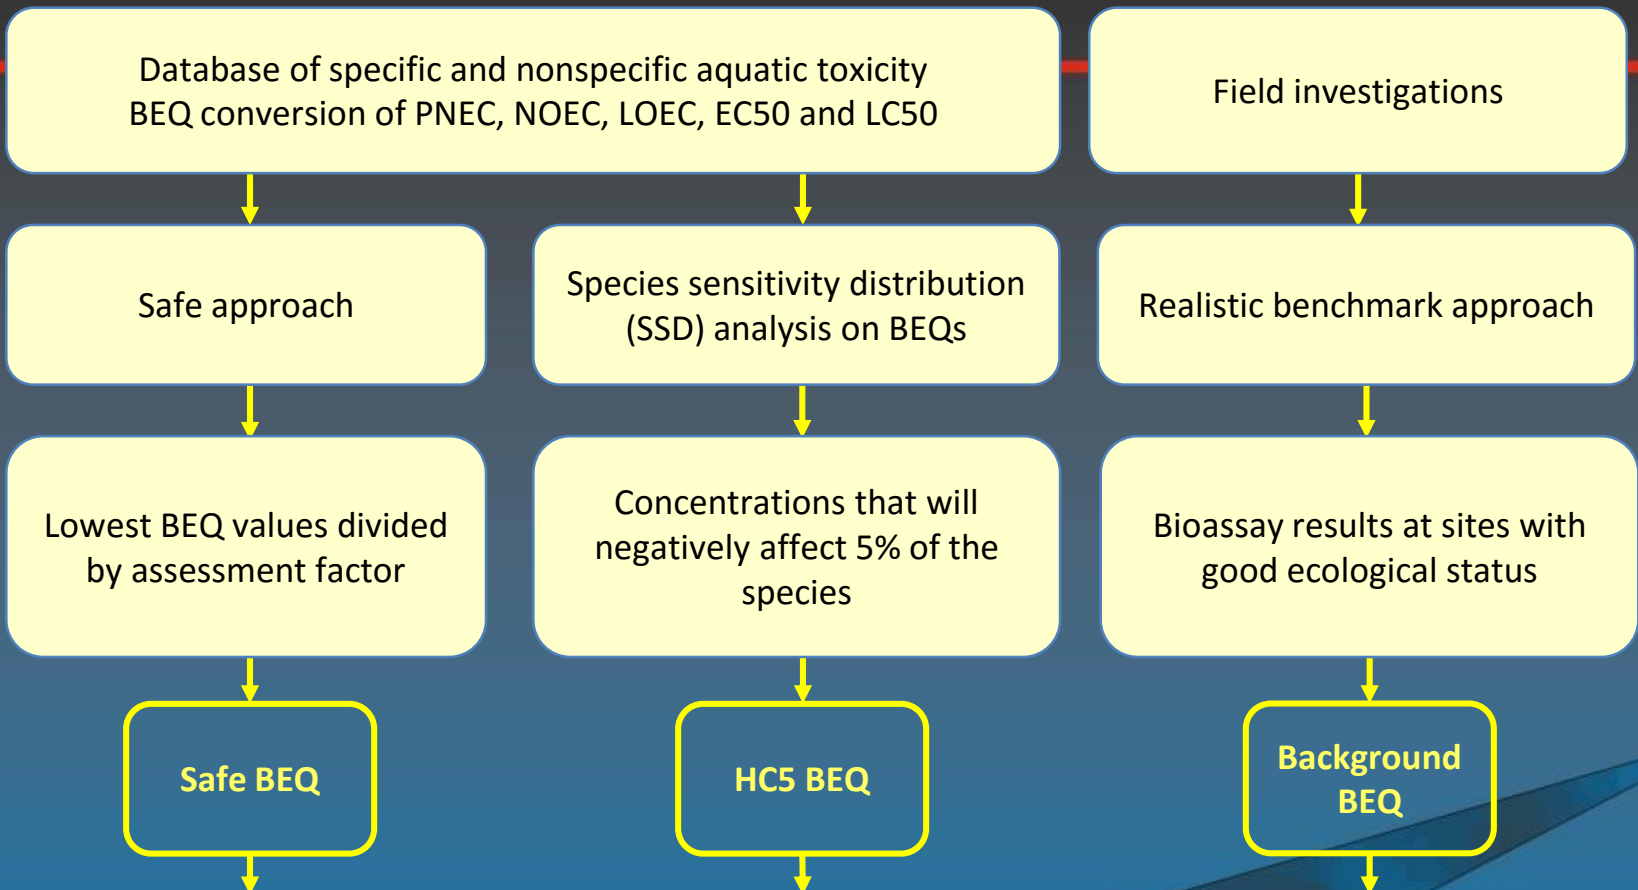

Selection toxicological endpoints SIMONI

- **In situ toxicity (water):**
 - Daphnids: mortality (1 week)
- **General toxicity (concentrated extracts)**
 - cel culture: cytotoxicity
 - Bacteria: luminescence
 - Algae: growth inhibition
 - Daphnids: mortality (immobilisation)
- **Specific toxicity (concentrated extracts)**
 - Endocrine disruption: ER, anti-AR, GR
 - Xenobiotics metabolism (DR, PXR)
 - PAH toxicity
 - Lipid metabolism: PPAR
 - Antibiotics activity (5 classes)
- **Reactive toxicity (concentrated extracts)**
 - Genotoxicity
 - Oxidative stress

SIMONI assumptions for trigger values

- Trigger values based upon chronic toxicity (or acute/10)
- Compounds selected for trigger value development relative effect potency (REP) >0.001 bioassay reference
- All adverse effects considered for trigger values:
 - Not only effects related to the endpoint mechanism
 - Not restricted to growth, reproduction and mortality
- Water concentrations \longrightarrow bioanalytical equivalents (BEQ)

Effect-based trigger values SIMONI

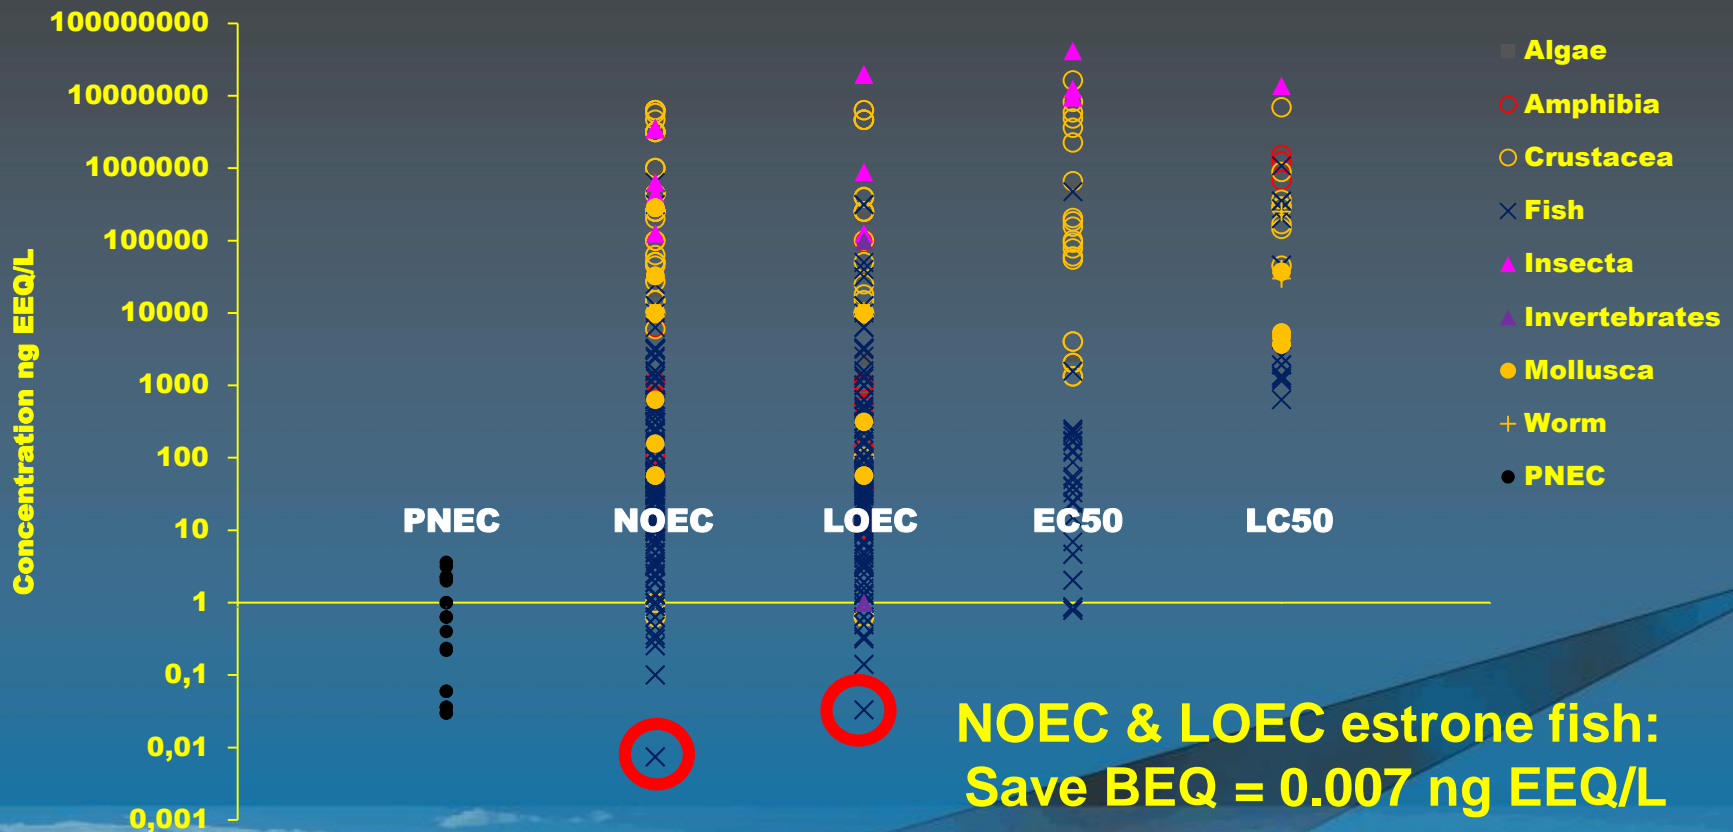

Evaluation algorithms:

- Background BEQ < HC5 BEQ => EBT ~ HC5 BEQ
- Background BEQ << HC5 BEQ => EBT ~ 5x Safe BEQ
- Background BEQ ~ HC5 BEQ => EBT within HC5 95% confidence interval
- Background BEQ > HC5 BEQ => EBT ~ 2x Background BEQ (chemical stress)

EBT

Safe BEQ: estrogenic EQ toxicity data

chronic [or acute/10] EEQ

HC5 BEQ: species sensitivity distribution

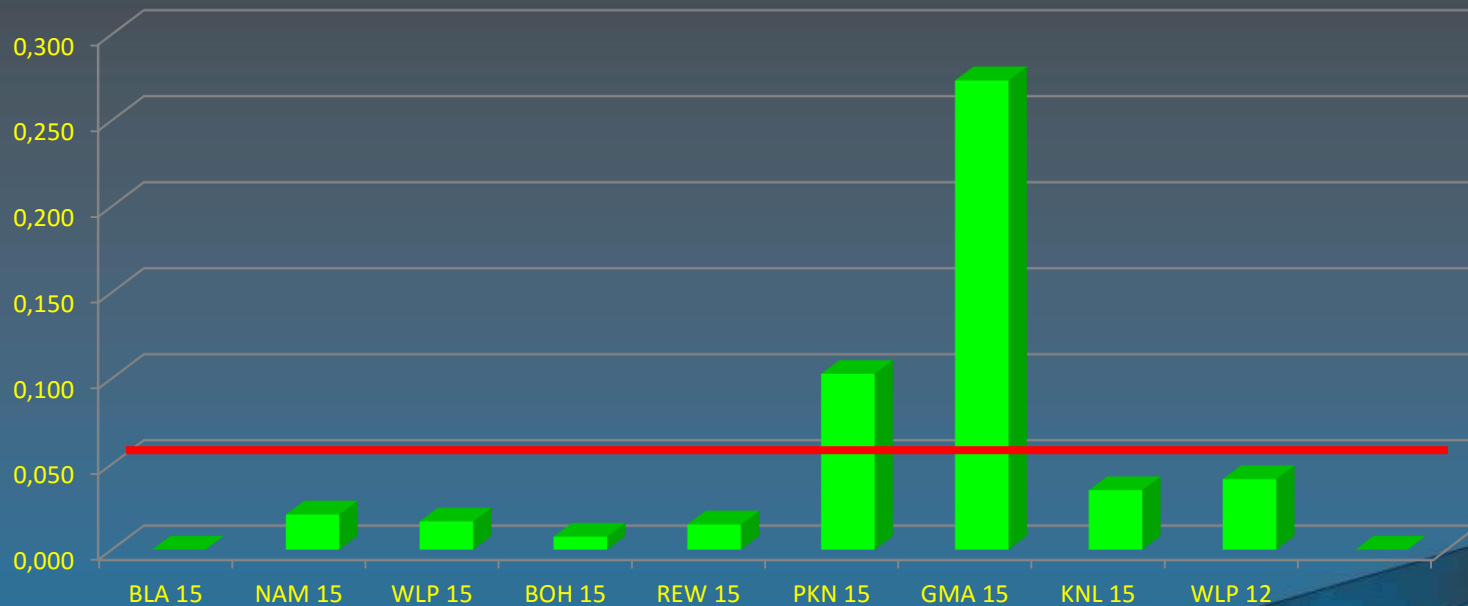

Estrogenic compounds: chronic EC50 EEQs

HC5 BEQ (hazard to 5% organisms) = 0.5 ng EEQ/L

Background BEQ: responses clean sites

ER CALUX

**Average activity at sites with good ecological status:
Background BEQ = 0.06 ng EEQ/L**

Evaluation estrogenic EBT (ER CALUX)

Safe BEQ: 0.007 EEQ/L

HC5 BEQ: 0.52 EEQ/L

Background BEQ: 0.06 EEQ/L

EBT = 0.5 EEQ/L

Jarosova et al., 2014: EBT = 0.2-0.4 EEQ/L

Kunz et al., 2015: EBT = 0.4 EEQ/L

Effect-based trigger values *in vitro*

Endpoints	Bioassays	Safe BEQ	HC5 BEQ	Background BEQ	EBT
Estrogenic	ERa CALUX (ng EEQ/L)	0.0066	0.52 (0,02-5.4)	0,06	0.5
Anti-androgenic	anti-AR CALUX (µg F1EQ/L)	0.00005	0.13 (0.05-0.27)	5	25
Dioxin and dioxin-like	DR CALUX (pg BEQ/L)	0.4	137 (15-736)	13	50
Glucocorticoid	GR CALUX (ng DEQ/L)	20	2145 (116-14311)	<1.2	100
PPARγ receptor	PPARγ CALUX (ng REQ/L)	0.00014	0.3 (0.002-6.9)	4	10
Reactive PAHs	PAH CALUX (ng BEQ/L)	0.04	47 (2-368)	63	150
Oxidative stress	Nrf2 CALUX (µg CEQ/L)	0.000006	0.034 (0.008-0.11)	4	10

SIMONI – effect-based risk assessment

Van der Oost et al., ET&C, in press (parts 1&2)

SIMONI 1.2: hotspots micropollutant risk

Risk = $\Sigma [(bioassay\ response/EBT) * bioassay\ weight] / 0,5 * total\ weight$

Highest ecological risks [score >1] in greenhouse areas (pesticide emission)

SIMONI 1.2: risks of wwtp emissions

Highest ecological risk [score >1] at undiluted wwtp emissions

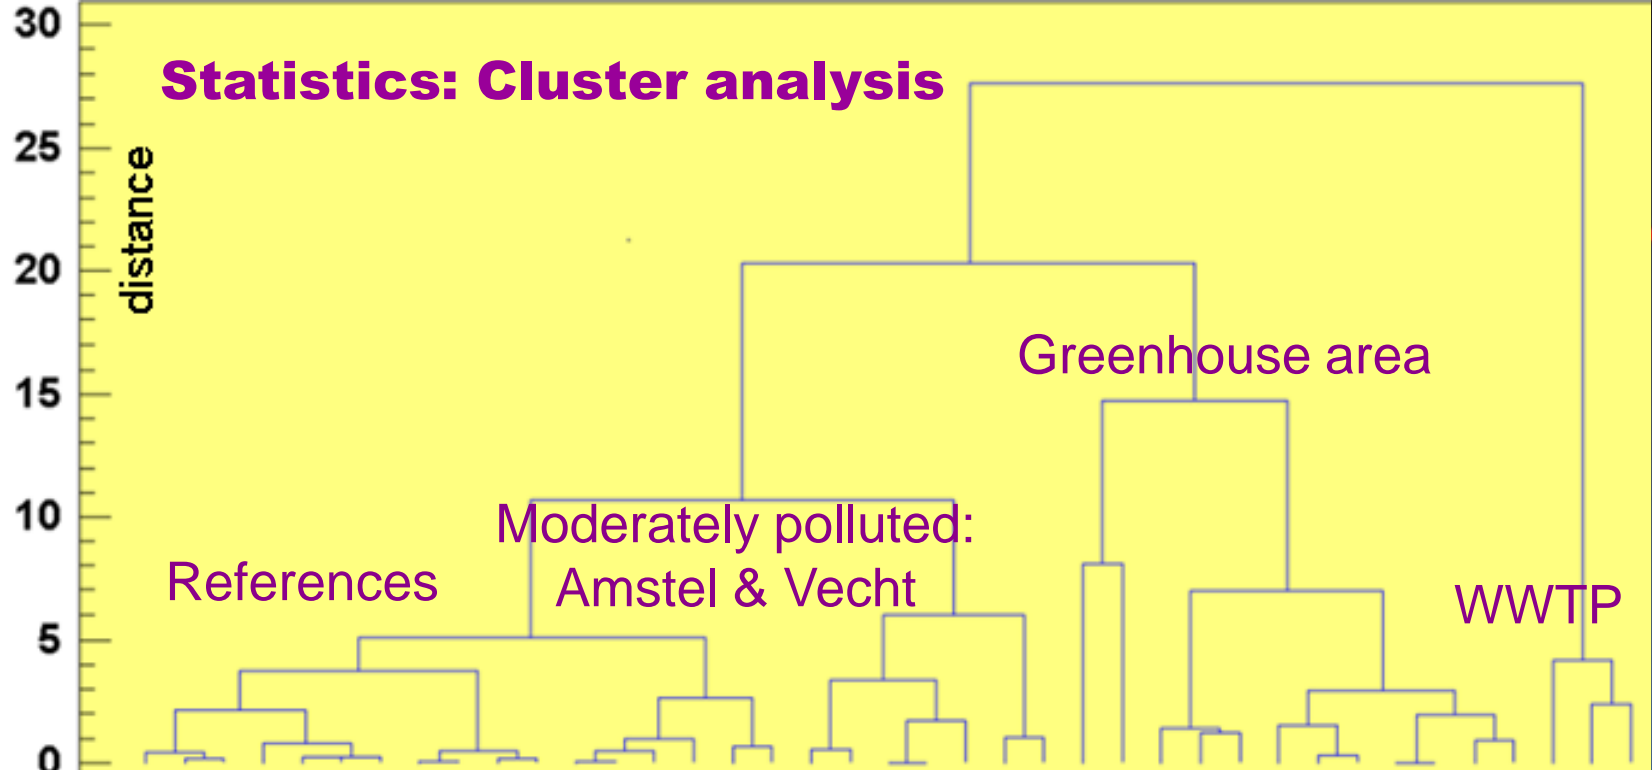

Statistics: Factor analysis (PCA)

Factor loadings

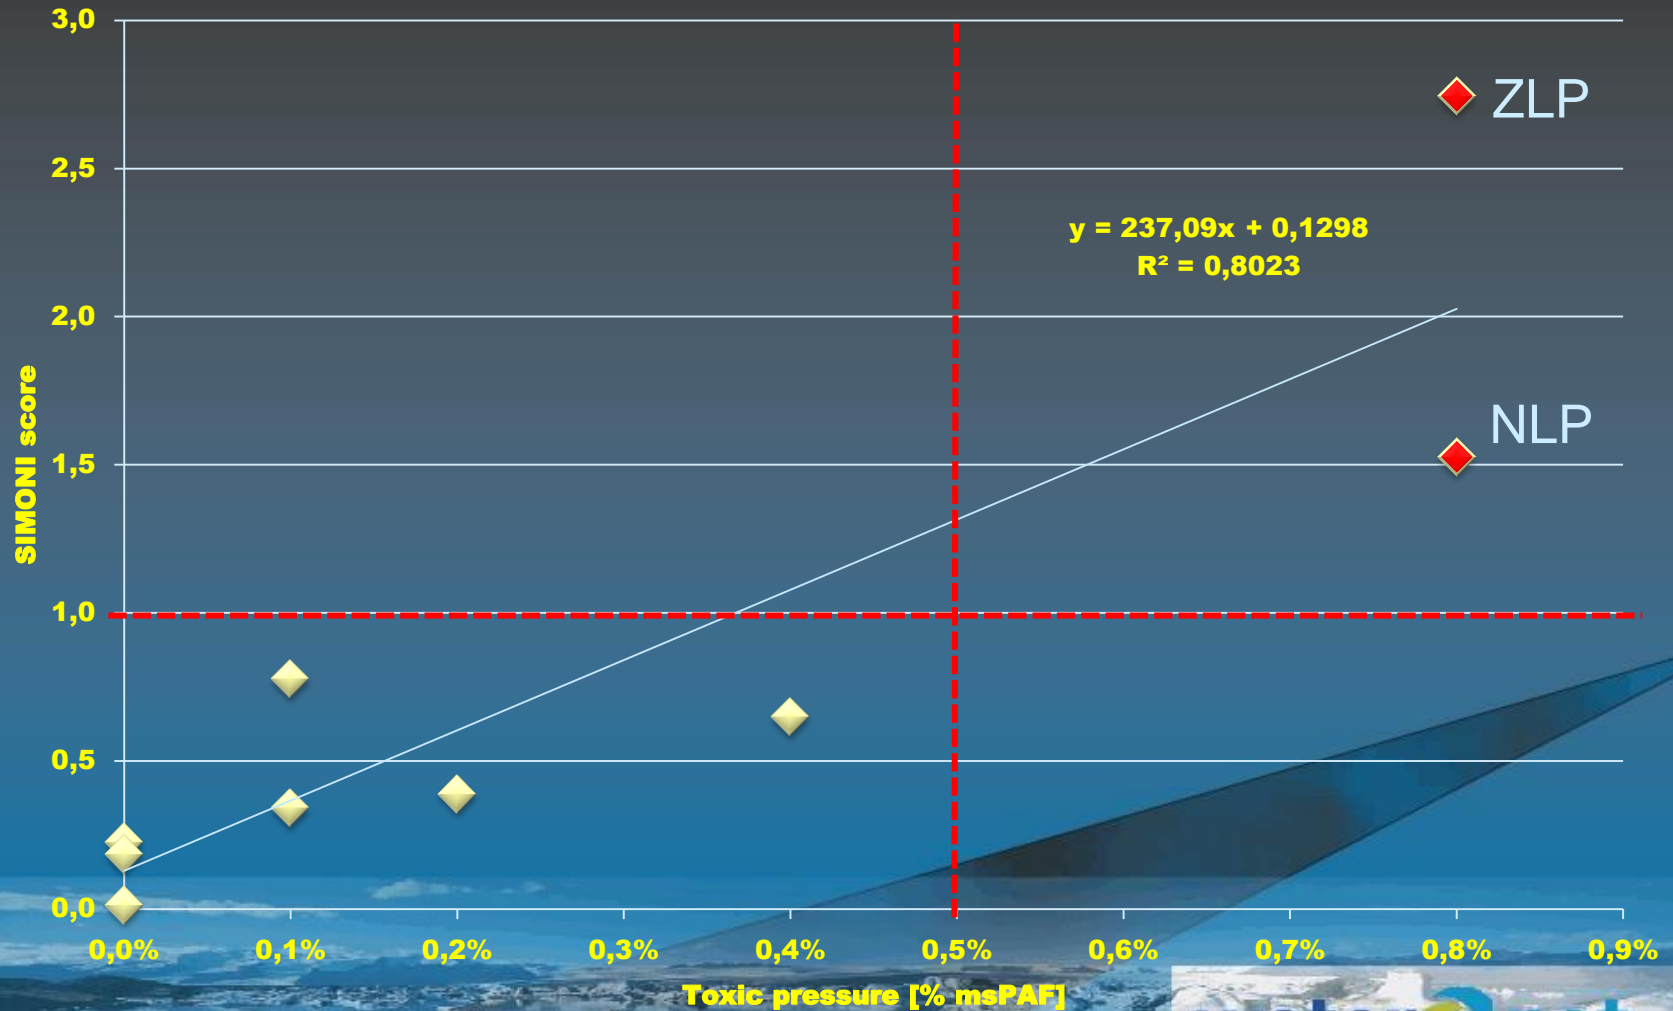

Sites scatter plot

Statistics: Cluster analysis

Waternet 2012: SIMONI vs. msPAF

Outline

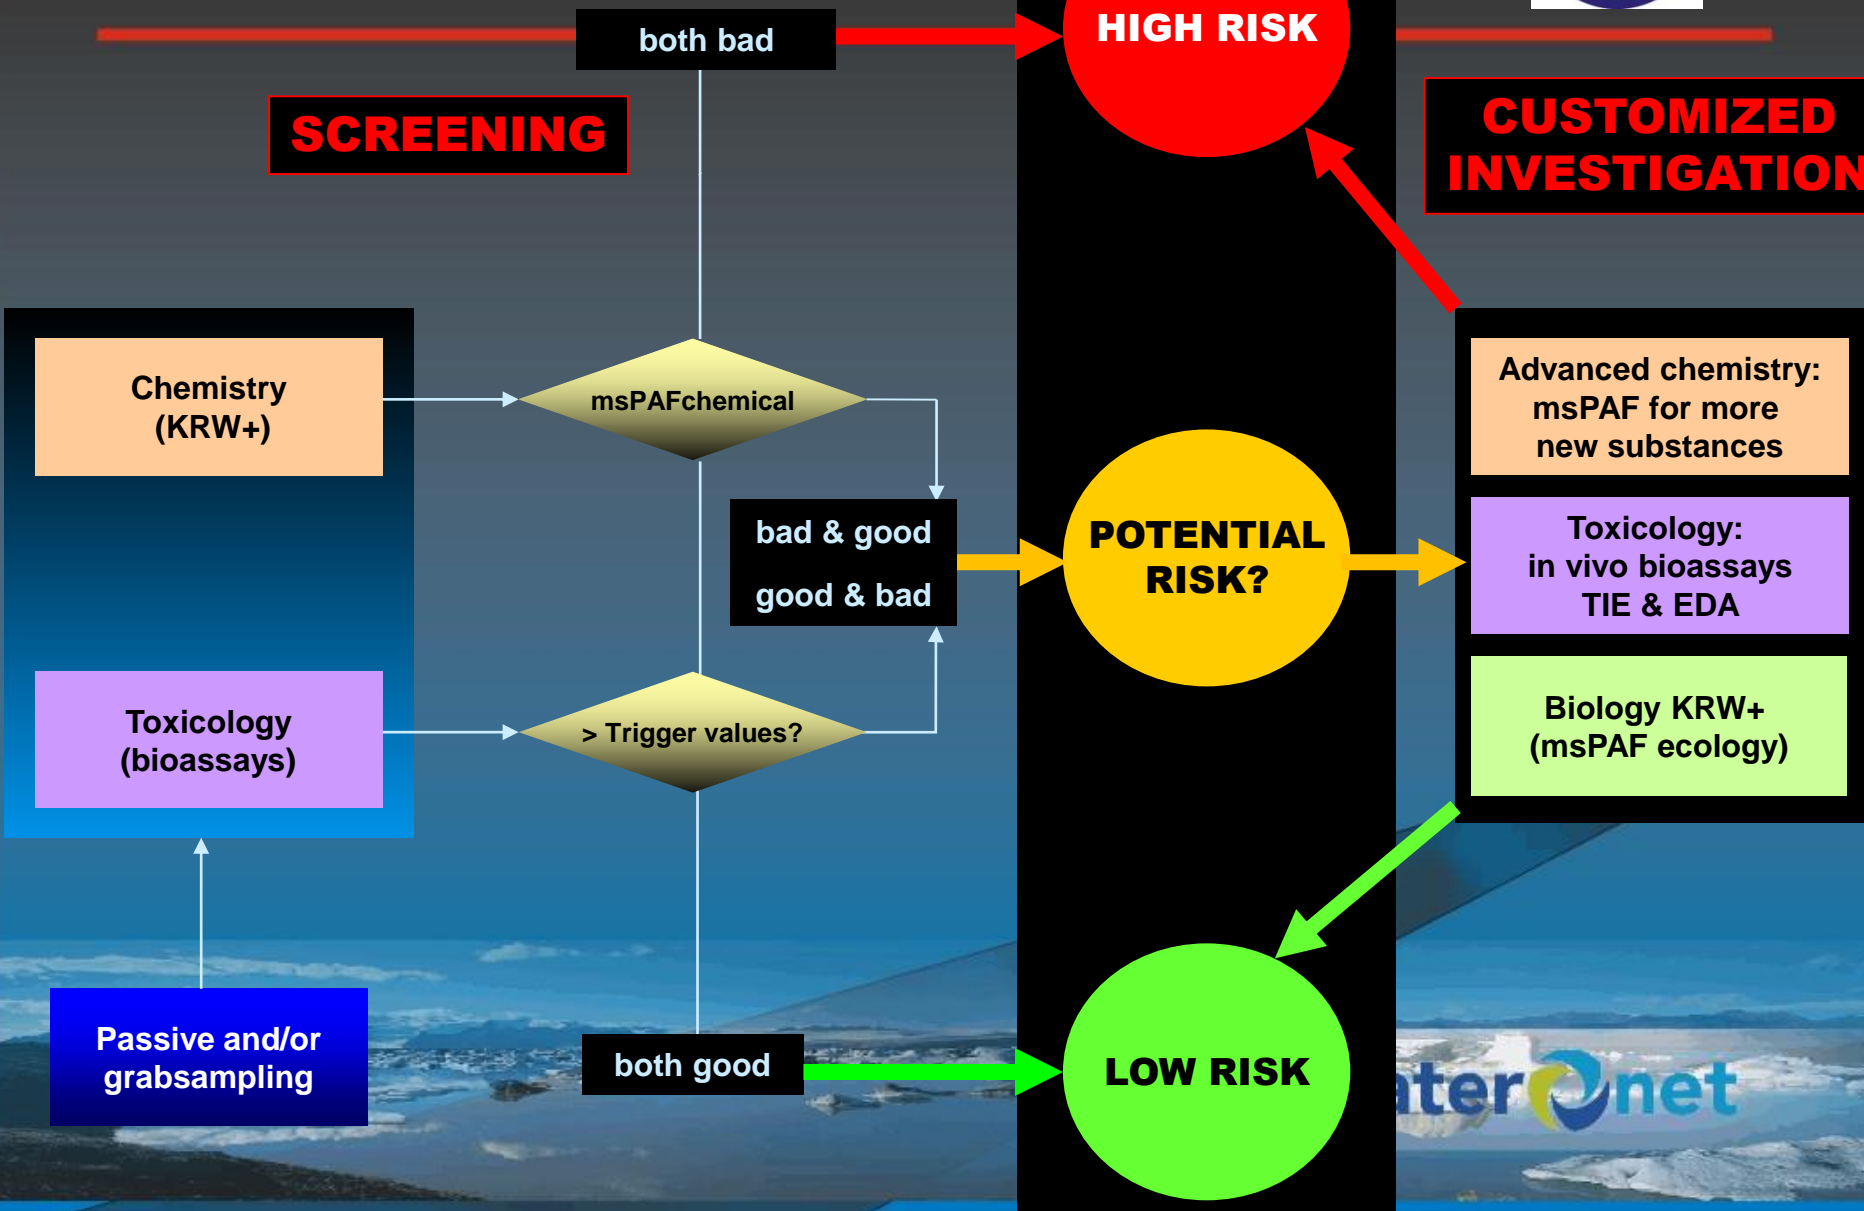

- **Micropollutant risks: substances or effects?**
- **Effect-based water quality monitoring**
- **SIMONI 1.2 model & effect-based trigger values**
- **Future of regular water quality monitoring..?**

The near future..?

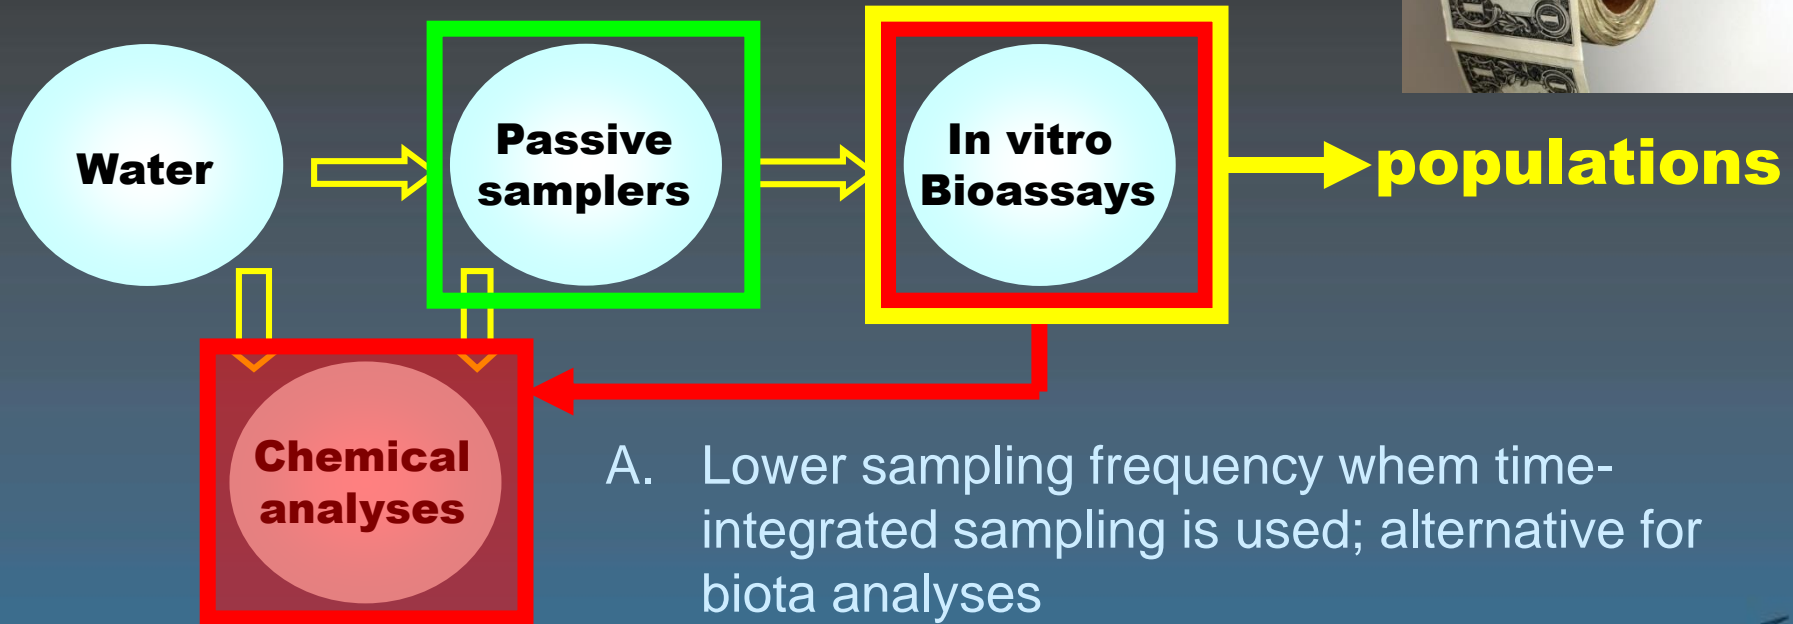

SCREENING

CUSTOMIZED INVESTIGATION

Cost reductions on monitoring

- A. Lower sampling frequency when time-integrated sampling is used; alternative for biota analyses
- B. Only advanced chemical analyses after responses in tox-screening
- C. Bioassay screening and innovative DNA testing to reduce costs for ecological research

Cost reductions on monitoring

- WFD chemical monitoring
 - 12x grabsamples (each month)
 - Chemical analyses of 45 priority pollutants
 - Costs around **€40,000**
- SIMONI 1.2
 - 2x passive sampling (different seasons)
 - Chemical analyses of metals & nutrients
 - Toxicological analyses with 5 non-specific & 10 specific bioassays
 - Costs around **€7,000**
 - Additional risk analysis **only at sites with potential risk!**

Uncertainties SIMONI vs. WFD?

SIMONI

- Bioassays or biomarkers
 - No (sensitive) response to all pollutants
- Passive sampling
 - Not all compounds accumulate in samplers

Uncertainties of combination?

Different mixture

WFD

- Grab sampling
 - Snapshot; variation and no information on bioavailability
- No information on >100,000 other chemicals in water cycle

What do we need...?

- Optimisation of bioassay selection and trigger values (UvA)
- Improved quantification of effects in passive sampler extracts
- Design of more 'simple' bioassays for effect measurement
- Design of less expensive EDA/TIE (HT-EDA)
- Support from other (EU) countries to use the SIMONI framework

Paradigm shift: substances → effects!

Thanks!
